It has an Ala for Val substitution at amino acid cresidue 343, i.e. in the reactive centre loop of the protein. The cut with the contrel copy of the protein. The mutant can be obtained by site-directed mutantenesis of PAI-1 DNA (see AAW797303) and expression in a host cell. Claimed PAI-1 mutants (see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may converted the protein of the protein stabilisting mutations comprising between one and converted by being resistant to inactivation by elastase, and by having a high affinity constructed by being resistant to inactivation by elastase, and by thaving a high affinity converted by sin and collagenase, and by having a high affinity converted by sin and are used, in vivo or in vitro, to inhibit converted by sintenests syndrome, acute lung inflammation, congenital alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthiftis and HIV infection). They also inhibit vn-stumulated cell attachment, migration and/or trauma, vascular graff restenosis, fibrosis (associated with characteristic pathological end fibrosis (associated with characteristic or metastases, psoriasis, deep vein thrombosis and any condition involving and fibrosis, growth/invasion of primary tumours or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiogenesis (alloamed). Since the mutants are resistant to cleavage by the proteases to which condition the pare more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1) condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

CC thuman plasminogen activator inhibitor (PAI-1) mature protein (see also AAWAJ587). It has an Asp for Val substitution at amino acid cresidue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAF97303) and expression in a host cell. Claimed PAI-1 mutants (see AAW26710-25) have at least one amino acid substitution at a stabilising mutations comprising between one and cfour of His-150, Thr-154, Leu-319 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A cc and B, stromelysin and collagenase, and by having a high affinity crespiratory distress syndrome, acute lung inflammation, congenital calpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, capancreatitis, periodontal disease, arthitis and HIV infection).

CC majoralion-induced proliferation (specifically in emphysema adult respiration-induced proliferation (specifically in atherosclerosis, cost-timely also inhibit vn-stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, cost-timely syndrome, confirmation after vascular graft restenosis, fibrosis (associated with chealing with scarring and fibrosis, stoweth/invasion of primary condition involving pathological angiogenesis (all claimed). Since they bind, they are more effective therapeutic agents. They also check and clearance of elastase (or its complex with PAI-1) and complex with PAI-1)
Sequence
                                                                                 promote uptake and clearance of elastase (or its complex with PAI-1) by receptors.

(see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutations comprising between one and four of His-150, Thr-154, Leu-319 and Ile-354, and one or more of four of His-150, Thr-154, Leu-319 and Ile-354, and one or more of arg 333, Arg-335, Gly-313, Ile-372 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, glasminogen activator, plasmin, cathepsin 6, chymase, gelatinases a and B stromelysin and collagenase, and by having a high affinity for vitronectin (Vn) and are used, in vivo or in vitro, to inhibit pathological elastase activity (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital alpha l-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthritis and HIV infection). They also inhibit vn-stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, fost-station, congenital charmation, and are secondary respectively. They also inhibit vn-stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, fost-station of primary trauma, vascular graft restenosis, fibrosis (associated with charmation after vascular trauma, vascular graft restenosis, fibrosis (associated with charmation involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they and clearance of elastase (or its complex with pair).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plasminogen activator inhibitor type 1; PAI-1; human; elastase; inhibitor; vitronectin; cell attachment; cell migration; cell proliferation; emphysema; adult respiratory distress syndrome; acute lung inflammation; alpha 1-antitrypsin deficiency; cystic fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HTV; atherosclerosis; restenosis; neohitima; fibrosis; wound healing; tumour; metastasis; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This polypeptide comprises a preferred mutant, PdGly (V943G), of human plasminogen activator inhibitor (PAI-1) mature protein (see also AAM31587). It has a Gly for Val substitution at amino acid residue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAM97303) and expression in a host cell. Claimed PAI-1 mutants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.

This polypeptide comprises a preferred mutant, P4Leu (V343L), of also AAW31587). It has a Leu for Val substitution at amino acid calso AAW31587). It has a Leu for Val substitution at amino acid considue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 Mutants (see AAW36710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutantions comprising between one and cour of His-530, Thr-154, Leu-319 and Leu-91. The mutants are characterised by being resistant to inactivation by elastiase, plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A and B, stromelysin and ore plasmin, cathepsin G, chymase, gelatinases A and B, stromelysin and are used, in vivo or in vitro, to inhibit pathological elastase activity (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             alpha l-antitrypsin deficiency, cystle fibrosis, atopic dermatitis, pariodontal disease, arthritis and HIV infection). They also inhibit Vn-stimulated cell attrachment, migration and/or post-angioplasty restenosis, neointima formation after vascular trauma, vascular graft restenosis, fibrosis (associated with chronic inflammation or chemotherapy, or of the lung), wound healing with scarring and fibrosis, growth/invasion of primary tumours or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they bind, they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents human plasminogen activator inhibitor-1, corrections of the invention of the enzyme in a detectable of the enzyme inhibitor to the active form of the enzyme by a detectable of label, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9M or less with the active of the detection of a functionally active form of an enzyme in a biological of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological of the detection of a functionally active form of an enzyme in a biological continuous plasminogen activator, urokinase, thrombin, plasmino, neutrophil of the enzyme sincluding tissue plasminogen activator, urokinase, thrombin, plasmino, neutrophil of elastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin G and prostate specific antigen and as such can be used in methods to diagnose (lassase such as cystic fibrosis, acute respiratory distress syndrome (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic hypertrophy.

Note: The present sequence is not shown in the specification but is certain detection of the mature PAI-1 sequence shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents human plasminogen activator inhibitor-1, (CC PAI-1, mutant P4Asp (V343D). PAI-1 is a serine proteinase inhibitor CC or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a country of the comprises detecting a functionally active form of an enzyme in a cc solid substrate with the biological sample and measuring the binding of cc the enzyme inhibitor to the active form of the enzyme by a detectable clabel, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10 9M or less with the active cf crm of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological sample. Human PAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil celastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin G and correct provides such as cystic fibrosis, courte respiratory distress syndrome cc (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic mypertrophy.

CC derived from the mature PAI-1 sequence shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

PAI-1 is a serine proteinase inhibitor or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a biological sample by contacting an enzyme inhibitor immobilised on a solid substrate with the biological sample and measuring the binding of the enzyme inhibitor to the active form of the enzyme by a detectable label, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9M or less with the active form of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological sample. Human PAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil elastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin G and prostate specific antigen and as such can be used in methods to diagnose diseases such as cystic fibrosis, acute respiratory distress syndrome (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic hypertrophy.

Note: The present sequence is not shown in the specification but is

The sequence represents human plasminogen activator inhibitor-1, corrections of the invention of the invention of reprintant PALEU (V343L). PAI-1 is a serine proteinase inhibitor or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a cooling substrate with the biological sample and measuring the binding of the enzyme inhibitor to the active form of the enzyme by a detectable cooling substrate with the biological sample and measuring the binding of the enzyme inhibitor to the active form of the enzyme by a detectable clibids, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9M or less with the active form of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological sample. Human pAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil constate specific antigen and as such can be used in methods to diagnose (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and consider the present sequence is not shown in the specification but is constant and the present sequence is not shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page - ; 69pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents human plasminogen activator inhibitor-1, correctly the (V3431). PAI-1 is a serine proteinase inhibitor CC PAI-1, mutant P411e (V3431). PAI-1 is a serine proteinase inhibitor CC which comprises detecting a functionally active form of the invention and CC which comprises detecting a functionally active form of an enzyme in a CC solid substrate with the biological sample and measuring the binding of CC the enzyme inhibitor to the active form of the enzyme by a detectable CC label, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9M or less with the active form of the enzyme. The present invention provides a sensitive method for CC the detection of a functionally active form of an enzyme in a biological consumple. Human PAI-1 can be used to detect a number of enzymes including CC sample. Human PAI-1 can be used to detect a number of enzymes including CC tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil clastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin G and prostate specific antigen and as such can be used in methods to diagnose CC diseases such as cystic fibrosis, acute respiratory distress syndrome benign prostatic hypertrophy.

Note: The present sequence is not shown in the specification but is considered from the mature PAI-1 sequence shown in figure 5.
                                                                                                                                                                                                                                                                                                                        Query Match 100.0%;

The Val residue of mature PAI-1 corresponds to residue 24 of the preprotein. It may alternatively begin MVH. The protein is used in tests to identify inhibitors of its binding to tissue plasminogen activator. It is also used therapeutically to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant functional human plasminogen activator inhibitor - and plasmid expression vectors for its prodn. in E. coli, used for assays of T-PA PAI-1 inhibitors and treatment of excessive fibrinolysis

The protein inhibits both t-pA and u-pA and is immunologically different from protease nexin and placental PAI. It can also be used in a solid phase assay for detection of endothelial PAI, and as an immunogen to raise antibodic for use as receptor molecules in other assay systems. See also AAP80252-54.

A human umbilical cord endothelial cell cDNA library was screened with 4 oligonucleotide probes based on the known PAI-1 sequence. A 2.1kb insert was identified in the most strongly positive clones. It was inserted into pT219R to give pECE3-1 and the sequence given here. To produce mature protein, the leader sequence was removed by partial digestion with ApaLI and NS11 of HaeIII-methylase treated pECE3-1 DNA. The resulting 1800bp fragment was attached to an adaptor (to restore the first 2, Met-Val, amino acids), digested with NcoI and inserted onto NcoI-PstI cleaved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Colonies of human endothelial cDNA were screened using the probe (AANB1522) and a heterologous antiserum to detect the presence of human endothelial PAI like polypeptides. Novel recombinant DNA molecule for use in cloning and/or expressing DNA sequence in host cells which contains, in addition to a vector protein, a DNA sequence coding for human PAI is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pKK233-2 to give plasmid ptAC-PAI. This expresses mature PAI-1 with the N-terminus Val-His-His which is useful in tests to identify inhibitors of its binding to tisse plasminogen activator. The protein is also used therapeutically to treat excessive or inappropriate fibrinolysis, e.g. during liver transplant surgery. See also AAQ06590-Q06593.

                                                                                                                                                                                  This polypeptide sequence comprises wild-type human plasminogen activator inhibitor type (PAI-1). Novel mutants (see AAW26710-25) c the PAI-1 mature protein are claimed that inhibit elastase or other elastase-like proteases, or are inhibitors of vitronectin-dependent cell migration. The mutants are obtained by site-directed mutagenesis of the PAI-1 DNA sequence (see AAT97303) and expression in host cells, and have a range of therapeutic uses. Preferred mutants have amino acid substitutions in the reactive centre loop region (especially at position 343 and/or 346 of the mature protein), and may have additional stabilising amino acid substitutions at 1-4 of residues 150, 154, 319 and 354, and 1-5 of residues 333, 335, 331, 372 and 91.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein search, using sw model
